Lab #7

Q1: Write a value-returning function, isVowel, that returns the value true if a given character is a vowel and otherwise returns false. Use switch statement in your solution

Q2: Write a program that prompts the user to input a sequence of characters and outputs the number of vowels. (Use the function isVowel written in *Question 1)*.

Q3: Write a function to displayPattern. The function takes one integer parameter called numOfLines for the size of the triangle. The function displays a triangle pattern on the screen, which has a height equivalent to numOfLines. The function uses the character "*" in displaying the pattern. The function does not return any value. Test your function with different number of lines.

Below is a sample of output with number of lines equals to 5:

```
    *
   * * *
  * * * * *
 * * * * * * *
* * * * * * * * *
```
